

# Infinite Scroll

---

Since there might be a lot of testimonials, you'll have to use the API endpoint's pagination functionality to repeatedly fetch a limited number of testimonials at a time. Specifically, the API accepts the following two query parameters:

- **limit** (required): the maximum number of testimonials to request
- **after** (optional): a string ID used as a cursor for pagination. For instance, if the last testimonial you fetched had an ID of **55**, adding **after=55** to the URL would fetch testimonials starting after the testimonial with ID **55**

For example, this would be a valid URL to request:

```
https://api.frontendexpert.io/api/fe/testimonials?limit=2&after=55
```
